Obesity and infection control highlighted as priorities in latest surgical audit report

Tuesday 22 November, 2016

The 7th National Report of the Australian and New Zealand Audits of Surgical Mortality (ANZASM) was released today by the Royal Australasian College of Surgeons (RACS), which highlighted an increase in obesity as a comorbidity, as well as recommending postoperative infection control as an area for improvement.

The ANZASM 2015 Report, involving the clinical review of all cases where patients have died while under the care of a surgeon, showed that since the last report, obesity has gradually overtaken hepatic (liver-related) issues as an increasingly observed comorbidity.

RACS recently issued a warning that an obesity epidemic is already upon us, which the Chair of ANZASM, Professor Guy Maddern, said was beginning to be reflected in the audit process.

“When we first started gathering national data on obesity in 2009, the incidence of obesity as a comorbidity for surgical mortality was approximately 2%. By the end of 2015, it was 4%.”

“Obesity still ranks behind other comorbidities in terms of its prevalence, but the increase shown in the audit is noteworthy. Obese patients are much more likely to present with multiple comorbidities, and as a result are at a greater risk of experiencing complications or adverse outcomes during and after surgery.”

Professor Maddern said that the increase in surgeon participation since the audit’s inception nationwide in 2009 has allowed for a much higher quality of information and for trends in data to be identified over time.

“Our participation has increased from 60% to almost 98%. We have access to much more comprehensive data which allows us to make more accurate longitudinal comparisons over time”.

"This not only helps us to self-regulate our profession, but also allows for valuable information to be made available to researchers and policy makers, as we have seen with the obesity example in this report".

The report also recommended a renewed focus on infection control, following a 3% rise in the number of clinically significant infections over the past two years. The increase was largely...

MEDIA RELEASE

Driven by a rise in the number of infections during a patient’s admission, and Professor Maddern said there remains scope to strengthen existing practices as there are regional variations.

“We first began collecting data on infection in patients undergoing surgery in 2012, and we are now at a point where we can begin to identify trends and implement strategies to prevent and minimise infections contracted both prior to and during surgery.”

“Surgical patients, particularly those with certain comorbidities, are more susceptible to developing infection. Improvements can be achieved by focusing on patient transfers to adequate control facilities, strengthening current guidelines for infection control procedures, especially hand washing, and revision of stringent training and adherence to patient care protocols.”

Professor Maddern said other key highlights from the 2015 report included:

- The proportion of cases with adverse events has remained relatively static (3.6% in 2012 compared to 3.4% in 2015).
- The most common issues experienced were delays related to the transfer (10.6%), inappropriateness of transfer (5.6%) and insufficient clinical documentation (4.3%).
- In the majority of instances those patients expected to benefit from critical care support did receive it. The review process suggested that 7% of patients who did not receive treatment in a critical care unit would most likely have benefited from it.
- Fluid balance in the surgical patient is an ongoing challenge, however the report highlights improvements are being made in this area.
- The audit revealed that patients admitted as surgical emergencies have a greater risk of falling while in hospital. All health professionals should increase their awareness of this risk to improve the quality and safety of patient care.
- Participation in the audit has increased significantly over time, and from 2017, the Australian Orthopaedic Association will make it compulsory for its members to partake.

Managed by RACS and funded by the state and territory departments of Health, the ANZASM presents the outcome of clinical reviews conducted into 23,292 deaths that completed the full audit process from 1 January 2009 to 31 December 2015.

The 2015 ANZASM Report is available on the RACS website:

About the Royal Australasian College of Surgeons (RACS)

RACS is the leading advocate for surgical standards, professionalism and surgical education in New Zealand and Australia. The RACS is a not-for-profit organisation that
